1. About this document

1.1. Scope

These operating instructions are valid for all MGB2-L1…-BR.-… / MGB2-L2…-BR.-… and MGB2-L1…-BP.-… / MGB2-L2…-BP.-….

These operating instructions, the document “Safety information and maintenance” and any enclosed data sheet form the complete user information for your device.

</tbody>
</table>

**Important!**

Always read all documents to gain a complete overview of safe installation, setup and use of the device. The documents can be downloaded from www.euchner.com. For this purpose enter the doc. no. in the search box.
2. Correct use

The system consists of at least one locking module MGB2-L1-…/MGB2-L2-… and one handle module MGB2-H-…

The safety system MGB2-L-… is an interlocking device with guard locking (type 4). Devices with unicode evaluation possess a high coding level, devices with multicode evaluation possess a low coding level.

The locking module can be configured with the aid of DIP switches. Depending on the setting, the locking module behaves like a BP or BR device (see chapter 2.1. Main differences, MGB2-BP and MGB2-BR on page 8). In addition the guard locking monitoring can be switched on or off. More detailed information about the possible settings is available in the chapter 13.7. Changing device configuration (using DIP switches) on page 32.

With active guard locking monitoring the following applies:

In combination with a movable guard and the machine control, this safety component prevents the guard from being opened while a dangerous machine function is being performed.

This means:

- Starting commands that cause a dangerous machine function must become active only when the guard is closed and locked.
- The guard locking must not be unlocked until the dangerous machine function has ended.
- Closing and locking a guard must not cause automatic starting of a dangerous machine function. A separate start command must be issued. For exceptions, refer to EN ISO 12100 or relevant C-standards.

With inactive guard locking monitoring the following applies:

In combination with a movable guard and the machine control, this safety component prevents dangerous machine functions from occurring while the guard is open. A stop command is triggered if the guard is opened during the dangerous machine function. With inactive guard locking monitoring, guard locking must be used only for process protection.

This means:

- Starting commands that cause a dangerous machine function must become active only when the guard is closed.
- Opening the guard triggers a stop command.
- Closing a guard must not cause automatic starting of a dangerous machine function. A separate start command must be issued. For exceptions, refer to EN ISO 12100 or relevant C-standards.

Before the device is used, a risk assessment must be performed on the machine, e.g. in accordance with the following standards:

- EN ISO 13849-1
- EN ISO 12100
- EN IEC 62061

Correct use includes observing the relevant requirements for installation and operation, particularly based on the following standards:

- EN ISO 13849-1
- EN ISO 14119
- EN IEC 60204-1

The safety system MGB2 can be combined only with the intended modules in the MGB2 system family.

On the modification of system components, EUCHNER provides no warranty for function.

Locking modules with the configuration MGB2-BR can be integrated into a BR switch chain.

Connection of several devices in a BR switch chain is permitted only using devices intended for series connection in a BR switch chain. Check the operating instructions for the related device.
Important!

- The user is responsible for the proper integration of the device into a safe overall system. For this purpose, the overall system must be validated, e.g. in accordance with EN ISO 13849-2.
- Correct use requires observing the permissible operating parameters (see chapter 16. Technical data on page 48).
- If a data sheet is included with the product, the information on the data sheet applies.

3. Description of the safety function

Devices from this series feature the following safety functions:

With active guard locking monitoring the following applies:

- **Monitoring of guard locking and the position of the guard** (interlocking device with guard locking according to EN ISO 14119)
  - Safety function (see chapter 6. Function on page 11):
    - The safety outputs are switched off when guard locking is released (monitoring of the locking element).
    - **Important**: This applies only if guard locking monitoring is active!
    - The safety outputs are switched off when the guard is open.
    - Guard locking can be activated only when the bolt tongue is located in the locking module (failsafe locking mechanism).
  - Safety characteristics: category, Performance Level, PFH₀ (see chapter 16. Technical data on page 48).

**Control of guard locking**

- Safety function
  - If the device is used as guard locking for personnel protection, control of guard locking must be regarded as a safety function.

  The safety level of guard locking control is determined by the device PFH₀ₐₐₐₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿˢᵉⁿ>s
  - Safety characteristics: category, Performance Level, PFH₀ (see chapter 16. Technical data on page 48).

With inactive guard locking monitoring the following applies:

- **Monitoring of the guard position** (interlocking device according to EN ISO 14119)
  - Safety function: The safety outputs are switched off when the guard is open (see chapter 6. Function on page 11).
  - Safety characteristics: category, Performance Level, PFH₀ (see chapter 16. Technical data on page 48).

The following applies to devices with emergency stop:

- **Emergency stop** (emergency stop device according to EN ISO 13850)
  - Safety function: emergency stop function
  - Safety characteristics: B₁₀₀₀ value (see chapter 16. Technical data on page 48)
4. Exclusion of liability and warranty
In case of failure to comply with the conditions for correct use stated above, or if the safety regulations are not followed, or if any servicing is not performed as required, liability will be excluded and the warranty void.

5. General safety precautions
Safety switches fulfill personnel protection functions. Incorrect installation or tampering can lead to fatal injuries to personnel.
Check the safe function of the guard and, if necessary, other safety functions particularly
› after any setup work
› each time after replacement of a component relevant to safety
› after an extended period without use
› after every fault
› after any change to the DIP switch settings
Independent of these checks, the safe function of the guard should be checked at suitable intervals as part of the maintenance schedule.

**WARNING**
Danger to life due to improper installation or due to bypassing (tampering). Safety components fulfill a personnel protection function.
› Safety components must not be bypassed, turned away, removed or otherwise rendered ineffective. On this topic pay attention in particular to the measures for reducing the possibility of bypassing according to EN ISO 14119:2013, section 7.
› The switching operation is allowed to be triggered only by the intended handle module MGB2-H... that is positively fastened to the guard.
› Prevent bypassing by means of replacement actuators (only for multicode evaluation). For this purpose, restrict access to actuators and to keys for releases, for example.
› Mounting, electrical connection and setup only by authorized personnel possessing the following knowledge:
  - specialist knowledge in handling safety components
  - knowledge about the applicable EMC regulations
  - knowledge about the applicable regulations on operational safety and accident prevention.

**Important!**
Prior to use, read the operating instructions and keep these in a safe place. Ensure the operating instructions are always available during mounting, setup and servicing. For this reason you should archive a printed copy of the operating instructions. You can download the operating instructions from www.euchner.com.
6. Function

6.1. Locking module MGB2-L1/L2

Together with a handle module, the locking module makes it possible to lock movable guards. The combination also serves as a mechanical door stop at the same time.

The following switch-on condition applies to the safety outputs FO1A and FO1B (also see chapters 15.2. System status table MGB2-BR on page 43 and 15.3. System status table MGB2-BP on page 45):

<table>

<td>NOT RELEVANT</td>
<td>NOT RELEVANT</td>
</tr>
</tbody>
</table>

FO1A and FO1B are ON

The locking module detects the position of the guard and the position of the bolt tongue. The position of the guard locking is also monitored.

Guard locking monitoring can be deactivated using DIP switches (see chapter 13.7. Changing device configuration (using DIP switches) on page 32).

Important!

For use as guard locking for personnel protection in accordance with EN ISO 14119, guard locking monitoring must be active.

The bolt tongue in the handle module is moved into and out of the locking module by actuating the door handle.

When the bolt tongue is fully inserted into the locking module, the locking arm locks the bolt tongue in this position. Depending on version, this locking is by spring force or solenoid force.
6.2. Guard locking for version MGB2-L1

(Guard locking actuated by spring force and released by power-ON)

Activating guard locking: close guard; no voltage at the solenoid.

Releasing guard locking: apply voltage to the solenoid.

The spring-operated guard locking functions in accordance with the closed-circuit current principle. If the voltage is interrupted at the solenoid, the guard locking remains active and the guard cannot be opened directly.

Important!
If the guard is open when the power supply is interrupted and is then closed, guard locking is activated. This can lead to persons being locked in unintentionally.

As long as the guard locking is closed, the bolt tongue cannot be pulled out of the locking module and the guard is locked. If voltage is applied to the guard locking solenoid, the guard locking is opened and bolt tongue is released. The guard can be opened.

6.3. Guard locking for version MGB2-L2

(Guard locking actuated by power-ON and released by spring force)

Important!
Use as guard locking for personnel protection is possible only in special cases, after strict assessment of the accident risk (see EN ISO 14119:2013, section 5.7.1).

Activating guard locking: apply voltage to the solenoid.

Releasing guard locking: disconnect voltage from the solenoid.

The magnetically actuated guard locking operates in accordance with the open-circuit current principle. If the voltage is interrupted at the solenoid, the guard locking is released and the guard can be opened directly!

The guard can be opened as long as no voltage is applied to the guard locking solenoid.

If voltage is present at the guard locking solenoid, the guard locking is held in the locked position and the guard is locked.
7. System overview

7.1. Locking module MGB2-L-...

Key:
1. Interlocking/locking module (MGB2-I-... / MGB2-L-...)
2. Escape release, optional (MGB-E-...)
3. Handle module (MGB2-H-...)

7.2. Handle module MGB2-H-...

Key:
1. Door handle
2. Hinged lockout mechanism
3. Automatically extending lockout mechanism (optional)
4. Auxiliary markings for max. permissible mounting distance
5. Bolt tongue
6. Locking bolt for handle adjustment

Notice:
Depending on version, additional controls and indicators may be integrated into the cover and a mounting plate can be included. See enclosed data sheet.
7.3. Escape release MGB-E-... (optional)

Key:
1. Door handle
2. Housing
3. Actuation axis 8 x 8 mm
   (different lengths available)
4. Protective sleeve

Notice:
Depending on version, a mounting plate can be included.
See enclosed data sheet.
7.4. Dimension drawing

Figure 5: Dimension drawing of MGB2 fitted, without optional mounting plates
8. Manual release

Some situations require the guard locking to be released manually (e.g. malfunctions or an emergency). A function test should be performed after release.

More information on this topic can be found in the standard EN ISO 14119:2013, section 5.7.5.1. The device can feature the following release functions:

8.1. Auxiliary release and auxiliary key release (can be retrofitted)

In the event of malfunctions, the guard locking can be released with the auxiliary release irrespective of the state of the solenoid.

The safety outputs \( \square \) are switched off when the auxiliary release is actuated. Use the safety outputs \( \square \) to generate a stop command.

The monitoring output \( \square \) is switched off; \( \square / \square \) indicates the current state of the guard. Open the guard and close it again after resetting the auxiliary release. The device will then operate normally again.

8.1.1. Actuating auxiliary release

1. Remove seal label or make a hole.
2. Undo locking screw.
3. Using a screwdriver, turn the auxiliary release to \( \square \) in the direction of the arrow.
   \( \Rightarrow \) Guard locking is released.

![Figure 6: Auxiliary release](image)

- When release monitoring is active, the system enters into a latching fault when the auxiliary release is actuated. See System status table, signal sequence incorrect status (DIA red, Lock flashes 1 time).
- The system might not enter into a latching fault if the auxiliary release is actuated very slowly.

Important!

- The auxiliary release must be reset at the control system level, e.g. by means of a plausibility check (status of the safety outputs does not match the guard locking control signal). See EN ISO 14119:2013, sec. 5.7.5.4.
- The auxiliary release is not a safety function.
- The machine manufacturer must select and use a suitable release (escape release, emergency release, etc.) for a specific application. A hazard assessment is required for this purpose. It may be necessary to take specifications from a product standard into account.
- The correct function must be checked at regular intervals.
- Loss of the release function due to mounting errors or damage during mounting. Check the release function every time after mounting.
- Please observe the notes on any enclosed data sheets.

8.1.2. Actuating auxiliary key release

On devices with auxiliary key release (can be retrofitted), simply turn the key to release. Function as for auxiliary release. For mounting, see the auxiliary key release supplement.
8.2. Emergency release (can be retrofitted)

Permits opening of a locked guard from outside the danger zone without tools. For mounting, see the mounting supplement.

Important!
- It must be possible to operate the emergency release manually from outside the protected area without tools.
- The emergency release must possess a marking indicating that it may be used only in an emergency.
- The actuator must not be under tensile stress during manual release.
- The release function meets all other requirements from EN ISO 14119.
- The emergency release meets the requirements of Category B according to EN ISO 13849-1:2015.
- Loss of the release function due to mounting errors or damage during mounting.
- Check the release function every time after mounting.
- Please observe the notes on any enclosed data sheets.

8.2.1. Actuating emergency release

- Turn emergency release clockwise until it clicks into place.
- Guard locking is released.

To reset, press the snap-in bolt inward using a small screwdriver or similar tool and turn the emergency release back.

The safety outputs [X] are switched off when the emergency release is actuated. Use the safety outputs [F] to generate a stop command.

The monitoring output OL is switched off; OD/OT indicates the current state of the guard. Open the guard and close it again after resetting the emergency release. The device will then operate normally again.

8.3. Lockout mechanism

If the lockout mechanism is pivoted out, the bolt tongue cannot be extended. The lockout mechanism can be secured with padlocks (see Figure 7). This is intended to prevent people from being locked in unintentionally. The lockout mechanism does not fulfill any safety function.

- To pivot out, press the grooved part (possible only with bolt tongue retracted).

Key:
1. Hinged lockout mechanism
   Padlock Ø min. 2 mm, Ø max. 10 mm

2. Automatically extending lockout mechanism (optional)
   Padlock Ø min. 6 mm, Ø max. 10 mm

Notice:
You can fit up to three locks Ø 8 mm per lockout mechanism.

Figure 7: Lockout mechanism secured with padlock
8.4. Escape release (optional)
The escape release is used to open a locked guard from the inside without tools.

When release monitoring is active, the system enters into a latching fault when the escape release is actuated. See System status table, signal sequence incorrect status (DIA red, Lock flashes 1 time).

The system might not enter into a latching fault if the escape release is actuated very slowly.

Depending on the parameters set in your configuration environment, the system may enter into a latching fault if the escape release is actuated (see chapter 17. Troubleshooting and assistance on page 51).

Important!
- It must be possible to actuate the escape release manually from inside the protected area without tools.
- It must not be possible to reach the escape release from the outside.
- The bolt tongue must not be under tensile stress during manual release.
- The escape release meets the requirements of Category B according to EN ISO 13849-1:2015.
- The correct function must be checked at regular intervals.
- Please observe the notes on any enclosed data sheets.

- Fit escape release such that operation, inspection and maintenance are possible.
- The actuation axis for the escape release must be inserted min. 9 mm into the handle module. Note the information on the different profile widths in the chapter 8.4.1. Preparing escape release on page 19.
- Align escape release axis at right angles to the handle module. See Figure 9.
## 8.4.1. Preparing escape release

<table>
<thead>

</tr>
<tr>
<td></td>
<td>Standard escape release with 107 mm axis (order no. 100465) and extended actuation axis (order no. 106761)</td>
<td>Use extended actuation axis and protective sleeve and shorten to required length</td>
<td></td>
</tr>
</tbody>
</table>

Example without mounting plates:

1. Insert actuation axis. The snap ring A must be in contact with the escape release B.
2. Fit door handle.
3. Tighten fixing screw to 2 Nm and press in cap.
4. Fit protective sleeve.

**Figure 8:** Preparing escape release
9. Mounting

**WARNING**
Mounting must be performed only by authorized personnel.

With two-leaf hinged doors, one of the two door leaves must also be latched mechanically.
Use a rod latch (Item) or a double-door lock (Bosch Rexroth) for this purpose, for example.

---

**Important!**
- If installed flush, the switching distance changes as a function of the installation depth and the guard material.

---

**Tip!**
- The pushbuttons and indicators can be customized using replaceable color covers and labels.

For mounting steps, see Figure 9 and Figure 12 to Figure 17.

Attach system such that operation of the auxiliary release as well as inspection and maintenance are possible.

The locking screw must be screwed back in and sealed after mounting and after every use of the auxiliary release. (Seal labels order no. 155853.) Tightening torque 0.5 Nm.
Figure 9: Installation example for door hinged on the right (general view)
9.1. Replacing modules

**CAUTION**
Risk of damage to equipment or malfunction as a result of uncontrolled machine stop.
- The communication within the system is interrupted by the replacement of a module. If a process is running, this situation can result in an uncontrolled stop and damage to the installation or the product. Before replacement make sure the installation is in a suitable operating status.

An interlocking/locking module with the BP configuration can be replaced only in combination with an overall system restart. On the disconnection of the module connection, the system enters into a fault state. The related module and all downstream modules remain inactive until the overall system is restarted (fault state).

Interlocking/locking modules with the configuration BR are hot pluggable. It is therefore not necessary to restart the overall system.

9.2. Mounting submodules

**CAUTION**
Risk of damage to equipment or malfunction as a result of incorrect connection or a configuration change.
- Only submodules of connection types P, K and N can be used. Check the compatibility before installation. For information on the related connection type of a submodule, please refer to the sticker on the rear of the submodule or the data sheet for the related submodule. This is included with each submodule.
- Pay attention to the alignment of the submodule. See marking (a) in Figure 10: Mounting submodule. Submodules can also be installed rotated by 180°. The marking (a) always indicates the first position to be equipped. This is the emergency stop S1 position in the example below.
- Make sure the pins on the submodule slide straight into the guide. Tighten the cover screws to 0.5 Nm.
- If you use a submodule, pay attention to the correct alignment of the modules in relation to the labeling fields on the connection module. Incorrect assignments can cause serious malfunctions in your installation.
- Make sure no foreign bodies, e.g. swarf or wires, enter the open slots on the submodule. These can cause short circuits or contact problems.
- Avoid touching the contacts on the underside of the submodule. Risk of ESD damage and contact problems due to soiling.
- Unused submodule slots must be fitted with a cover (e.g. order number 126372).
9.3. Replacing submodules

**CAUTION**

- The communication between submodule and locking module is interrupted by the replacement of a submodule. The submodule ceases to function. The function of the locking module, e.g. the safety outputs FO1A / FO1B, is not affected. If a process is running, the removal/replacement of a submodule can result in an uncontrolled stop and damage to the installation or the product. Before replacement make sure the installation is in a suitable operating status.

**NOTICE**

Pay attention to the information on the replacement of a submodule in the operating instructions for the related module. Correct function must be tested after replacement before the system enters normal operation again.

The replacement of submodules MSM while in operation is also possible (pay attention to safety note above). As soon as the system detects a compatible submodule, the submodule is ready for operation.

If an incompatible submodule is installed, the Slot 1 LED illuminates red.

9.3.1. Replacing submodule with a submodule with a different function (changing configuration)

The use of a different submodule will change the function and as a result the terminal assignment (see data sheet for the submodule). Take into account the changes in your wiring and control system.
9.3.2. Fitting and removing lenses and labels for controls and indicators

Fitting

1. Insert the lens into the control.
2. Press the lens in until it clicks into place.
3. Check that the lens is secure and not loose.

Removing

1. Use a flat-bladed screwdriver to gently pry the lens from the control.
2. Lift the lens out of the control.

9.4. Changing direction of connection

**CAUTION**

Risk of damage to equipment or malfunction as a result of uncontrolled machine stop.

- The direction of connection can be changed after removing the covers and fitting them rotated by 180°.
- The communication within the system is interrupted if the internal wiring is changed. If a process is running, this situation can result in an uncontrolled stop and damage to the installation or the product. Before replacement make sure the installation is in a suitable operating status.

Figure 11: Changing direction of connection
10. Changing the door hinge position

10.1. Changing the interlocking/locking module to a different door hinge position

To change the interlocking/locking module for doors with a different door hinge position, the module only needs to be rotated by 180°. Submodules installed in the module can also be rotated by 180° (see section 9.1. Replacing modules on page 22).

10.2. Changing actuating direction of the handle module

(Here: from right to left)

<table>
<thead>
<tr>
<th>Important!</th>
</tr>
</thead>
<tbody>
<tr>
<td>It is possible to make this change only when the bolt tongue is not extended and an escape release is not yet mounted.</td>
</tr>
</tbody>
</table>

As supplied, the handle module is set either for doors hinged on the right or for doors hinged on the left.

Based on the example of a handle module for doors hinged on the right this means:

› The guard opens by pressing down the door handle.

› The system is mounted the other way up for doors hinged on the left. In other words, the guard opens by pressing up the door handle (see Figure 12). For this reason the actuating direction of the door handle must be changed (see Figure 12 to Figure 17).

(Similarly on handle modules for doors hinged on the left)
1. Press door handle up.

Figure 12: Changing actuating direction, step 1

2. Unscrew locking screws.

3. Push cover aside.

Figure 13: Changing actuating direction, steps 2 and 3

4. Lift the locking pin on the door handle using a screwdriver and hold it in this position.

5. Turn door handle to the right.

Figure 15: Changing actuating direction, steps 4 and 5

6. Only on the use of an escape release: using the Torx 10 screw, turn the joint counterclockwise from position (a) to position (b).

7. Close cover.

8. Screw in locking screws and tighten to 0.8 Nm.

Figure 14: Changing actuating direction, steps 6 to 8

9. Remove cap and undo screw.

10. Reposition the door handle by 90° in clockwise direction and fasten it again.

11. Tighten screw to 2 Nm and re-fit cap.

Figure 17: Changing actuating direction, steps 9 and 11

12. State after repositioning.

Figure 16: Changing actuating direction, final state
11. Protection against environmental effects

Lasting and correct safety function requires that the system must be protected against foreign bodies such as swarf, sand, blasting shot, etc., which can become lodged in the housing.

Pay attention to the following measures:

- Seal unused connections using the covers provided.
- Make sure the housing covers are correctly sealed and the cover screws are tightened to the necessary tightening torque.
- Cover the device during painting work.

12. Controls and indicators

![Diagram of indicators and control elements](image)

</table>
13. Electrical connection

**WARNING**

If there is a mistake, loss of the safety function due to incorrect connection.

- To ensure safety, both safety outputs (FO1A and FO1B) must always be evaluated.
- The monitoring outputs must not be used as safety outputs.
- Lay the connecting cables with protection to prevent the risk of short circuits.

**CAUTION**

Risk of damage to equipment or malfunctions as a result of incorrect connection.

- The inputs on a connected evaluation unit must be positive switching, as the two outputs on the safety switch deliver a level of +24 V in the switched-on state.
- All the electrical connections must either be isolated from the mains supply by a safety transformer according EN IEC 61558-2-6 with limited output voltage in the event of a fault, or by other equivalent insulation measures.
- All electrical outputs must have an adequate protective circuit for inductive loads. The outputs must be protected with a free-wheeling diode for this purpose. RC interference suppression units must not be used.
- Power devices which are a powerful source of interference must be installed in a separate location away from the input and output circuits for signal processing. The cable routing for safety circuits should be as far away as possible from the cables of the power circuits.
- To prevent EMC problems, it is imperative you follow the chapter 13.6. Notes on cable laying on page 31. Follow EMC notes on devices in the immediate vicinity of the MGB2 system and its cables.
- In order to avoid EMC interference, the physical environmental and operating conditions at the installation site of the device must comply with the requirements according to the standard DIN EN 60204-1:2006, section 4.4.2/EMC.

**Important!**

- If the device does not appear to function when the operating voltage is applied (e.g. green Power LED does not illuminate), the safety switch must be returned to the manufacturer.
- To ensure the stated degree of protection is achieved, the cover screws must be tightened to a tightening torque of 1 Nm.
- Tighten screw for the cover for the auxiliary release to 0.5 Nm.
13.1. Using submodules

Each interlocking/locking module can contain one submodule. For an exact description of the individual submodules as well as information on compatibility, please refer to the data sheet for the related submodule. This is included with each submodule.

**Important!**

- Only submodules of connection types P, K and N may be installed in the modules described here. For information on the related connection type of a submodule, please refer to the sticker on the rear of the submodule or the data sheet for the related submodule. This is included with each submodule.
- On using a submodule, pay attention to the correct alignment of the module in relation to the labeling fields on the connection submodule. Incorrect assignments can cause serious malfunctions in your installation.
- Unused submodule slots must be fitted with a cover (e.g. order number 126372).
- Avoid touching the contacts on the underside of the submodule. Risk of ESD damage and contact problems due to soiling.

13.2. Notes about

**Important!**

- For use and operation as per the requirements 1), a power supply with the feature “for use in class 2 circuits” must be used. The same requirement applies to the safety outputs. Alternative solutions must comply with the following requirements:
  a) Electrically isolated power supply unit with a max. open-circuit voltage of 30 V/DC and a limited current of max. 8 A.
  b) Electrically isolated power supply unit in combination with fuse as per UL248. This fuse should be designed for max. 3.3 A and should be integrated into the 30 V DC voltage section.
- The mounting of conduits directly on the MGB2 is not allowed. Cables are allowed to be connected only via suitable cable glands. For this purpose use EUCHNER cable gland of type EKPM20/06U. Equivalent cable glands can be used if they are UL-listed (QCRV) and are suitable for the related cable diameter (22 AWG – 17 AWG).

1) Note on the scope of the UL approval: Only for applications as per NFPA 79 (Industrial Machinery). The devices have been tested as per the requirements of UL508 (protection against electric shock and fire).

13.3. Safety in case of faults

- The operating voltage UB is reverse polarity protected.
- The safety outputs FO1A/FO1B are short circuit-proof.
- A short circuit between FI1A and FI1B or FO1A and FO1B is detected by the device.
- A short circuit in the cable can be excluded by laying the cable with protection.
13.4. Fuse protection for power supply

The power supply must be provided with fuse protection depending on the number of devices and the current required for the outputs. The following rules apply:

**Max. current consumption of an individual device \( I_{\text{max}} \)**

\[
I_{\text{max}} = I_{UB} + I_{IMP} + I_{FO1A+FO1B}
\]

- \( I_{UB} \) = Device operating current (80 mA) + monitoring outputs (4 x max. 50 mA) + control elements
- \( I_{FO1A+FO1B} \) = Load current of safety outputs F01A + F01B (2 x max. 150 mA)
- \( I_{IMP} \) = Solenoid (max. 375 mA)

**Max. current consumption of a switch chain \( \Sigma I_{\text{max}} \) with star wiring**

\[
\Sigma I_{\text{max}} = I_{FO1A+FO1B} + n \times I_{UB} + n \times \text{monitoring outputs} + n \times I_{IMP}
\]

\( n \) = Number of connected devices

**Assignment of the currents to the fuse circuits**

<table>
<thead>
<tr>
<th>Current</th>
<th>Fuse circuit F1</th>
<th>Fuse circuit F2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( I_{UB} )</td>
<td>( 80 \text{ mA} ) \enter ( I_{OD,OT,OL,OI} = (4 \times \text{max. 50 mA}) ) \enter ( I_{\text{control elements}} = \text{max. 10 mA} ) \enter ( \text{(per control element)} ) \enter ( I_{\text{indicators}} = \text{max. 5 mA} ) \enter ( \text{(per indicator)} )</td>
<td></td>
</tr>
<tr>
<td>( I_{FO1A+FO1B} )</td>
<td>( 2 \times \text{max. 150 mA} )</td>
<td></td>
</tr>
<tr>
<td>( I_{IMP} )</td>
<td>( I_{\text{solenoid}} = 375 \text{ mA} )</td>
<td></td>
</tr>
</tbody>
</table>

13.5. Requirements for connecting cables

**CAUTION**

Risk of damage to equipment or malfunctions as a result of incorrect connecting cables.

- On the use of other connection components, the requirements in the following table apply.
- EUCHNER provides no warranty for safe function in case of failure to comply with these requirements.

Observe the following requirements with respect to the connecting cables:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conductor cross-section, min.</td>
<td>0.25</td>
<td>( \text{mm}^2 )</td>
</tr>
<tr>
<td>( R ) max.</td>
<td>60</td>
<td>( \Omega/\text{km} )</td>
</tr>
<tr>
<td>( C ) max.</td>
<td>120</td>
<td>nF/( \text{km} )</td>
</tr>
<tr>
<td>( L ) max.</td>
<td>0.65</td>
<td>nH/( \text{km} )</td>
</tr>
</tbody>
</table>
13.6. Notes on cable laying

Lay all MGB2 connecting cables in a common cable harness.

\(\textbf{Important: lay cables in a common harness}\)

Figure 19: Stipulated cable laying
13.7. Changing device configuration (using DIP switches)

Tip!
You will find an animation on device configuration at www.euchner.com.

DIP switches
The device can be configured using the DIP switches. The following settings are possible:

- Changing system family (BR/BP switching)
- Deactivating guard locking monitoring
- Activating release monitoring (possible only with active guard locking monitoring)

Position of the switches

<table>
<thead>
<tr>

         | off: configuration inhibited (factory setting) |

13.7.1. Changing system family (BR/BP switching)

CAUTION
Malfunction due to incorrect configuration or incorrect connection.

- Note that the terminal assignment also changes on changing the configuration (see chapter 13.10. Terminal assignment and contact description on page 36).

1. Switch off power supply.
2. Set DIP switches 1, 4 and 8 as shown.

For change from BR => BP

For change from BP => BR

3. Switch on power supply for 5 s.
- The change is confirmed by the illumination of the Power LED. All other LEDs are off.
4. Switch off power supply and set DIP switch 8 to OFF.
- The next time the device is started, it operates in the operating mode set.
13.7.2. Deactivating guard locking monitoring

**WARNING**
Risk of injury due to inactive guard locking monitoring.
- If guard locking monitoring is inactive, the guard locking position does not influence the safety outputs. The guard can be opened immediately. This setting is not allowed to be used in applications in which, e.g., there is hazard due to overrunning machinery movement. With inactive guard locking monitoring, guard locking must be used only for process protection.

1. Switch off power supply.
2. Set DIP switches 2, 5 and 8 as shown.

<table>
<thead>
<tr>
<th>Deactivating guard locking monitoring</th>
<th>Activating guard locking monitoring</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

3. Switch on power supply for 5 s.
   - The change is confirmed by the illumination of the Power LED. All other LEDs are off.
4. Switch off power supply and set DIP switch 8 to OFF.
   - The next time the device is started, it operates in the operating mode set.

13.7.3. Activating release monitoring

**NOTICE**
When release monitoring is active, the system enters into a latching fault when the escape release or auxiliary release is actuated.

See System status table, signal sequence incorrect status (DIA red, Lock flashes 1 time).

1. Switch off power supply.
2. Set DIP switches 3 and 8 as shown.

<table>
<thead>
<tr>
<th>Deactivating release monitoring</th>
<th>Activating release monitoring</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="DIP Switches" /></td>
<td><img src="image" alt="DIP Switches" /></td>
</tr>
</tbody>
</table>

3. Switch on power supply for 5 s.
   - The change is confirmed by the illumination of the Power LED. All other LEDs are off.
4. Switch off power supply and set DIP switch 8 to OFF.
   - The next time the device is started, it operates in the operating mode set.
13.8. Notes on operation with control systems

Please observe the following requirements for connection to safe control systems:

General notes

› Use a common power supply for the control system and the connected safety switches.

› A pulsed power supply must not be used for UB. Tap the supply voltage directly from the power supply unit. If the power supply is connected to a terminal of a safe control system, this output must provide sufficient electrical current.

› The safety outputs (FO1A and FO1B) can be connected to the safe inputs of a control system. Prerequisite: the input must be suitable for pulsed safety signals (OSSD signals, e.g. from light grids). The control system must tolerate test pulses on the input signals. This normally can be set up by parameter assignment in the control system. Observe the notes of the control system manufacturer. For the pulse duration of your safety switch, please refer to chapter 16. Technical data on page 48.

› The inputs on a connected evaluation unit must be positive switching, as the two outputs on the safety switch deliver a level of +24 V in the switched-on state.

› Always connect inputs FI1A and FI1B directly to a power supply unit or to outputs FO1A and FO1B of another EUCHNER BR device (series connection). Pulsed signals must not be present at inputs FI1A and FI1B.

Guard locking control

› Test pulses up to max. 5 ms in duration at intervals of min. 100 ms are tolerated on IMP and IMM.

---

NOTICE

Due to the fact that short circuit monitoring of the safety outputs FO1A/FO1B is performed by the device itself, the Performance Level in accordance with EN 13849 is not reduced if the control system pulsing is switched off.

Tip!

A detailed example of connecting and setting the parameters of the control system is available for many devices at www.euchner.com in the area Download • Applications • MGB2. The features of the respective device are dealt with there in greater detail.

13.12. Operation as separate device

The switches can be reset via the RST input. For this purpose, a voltage of 24 V (± permissible tolerances) must be applied to the input for \( t > 3 \) s. During the time when this voltage is present on the input, all LEDs and outputs (door monitoring and safety outputs) are switched off. The device restarts on the falling edge of the voltage.
13.13. Information on operation in a BR switch chain

13.13.1. System times
The locking module has different reaction times compared to a CES-BR switch (see chapters 16. Technical data on page 48 and 16.2. Typical system times on page 50).

13.13.2. Wiring of a BR switch chain
To prevent earth loops, the wiring should be in a star configuration (see Figure 25).

Important: lay cables in a common harness

Figure 25: Central wiring of a BR switch chain in the control cabinet

13.13.3. Number of devices in switch chains
In a pure MGB2 switch chain a maximum of ten devices can be connected in series. In mixed switch chains (e.g. MGB2 together with CES-BR) the maximum number of devices is also ten.

13.13.4. Resetting in switch chains

Use the reset input (RST) for resetting in BR switch chains. All devices in the chain must be reset simultaneously. Resetting individual switches will result in faults.
14. Setup

14.1. Teach-in operation (only for MGB2 unicode)

The handle module must be assigned to the locking module using a teach-in function before the system comprising locking module and handle module forms a functional unit.

During a teach-in operation the safety outputs are switched off.

---

**Important!**

- The locking module disables the code for the previous handle module if teach-in is carried out for a new handle module. Teach-in is not possible again immediately for this device if a new teach-in operation is carried out. The disabled code is deleted in the locking module only after a third code has been taught in.
- The locking module can be operated only with the last handle module taught in.
- If, in the teach-in standby state, the locking module detects the taught-in handle module, the teach-in standby state is ended immediately and the locking module changes to normal operation.
- If the bolt tongue is in the operating distance for less than 30 s, the handle module is not taught in.

---

Teaching in handle module

1. Fit handle module.
2. Close safety system. Check for correct alignment and distance using the marking on the locking module and re-adjust if necessary.
3. Insert bolt tongue into the locking module.
4. Apply operating voltage to the locking module, optionally connect teach-in adapter.
   - The green LED (State) flashes quickly (approx. 5 Hz). A self-test is performed during this time (approx. 1 s in case of BP configuration and approx. 5 s in case of BR configuration). Teach-in operation starts, green LED (State) flashes slowly (approx. 1 Hz). During the teach-in operation, the locking module checks whether the handle module is a disabled handle module. If this is not the case, the teach-in operation is completed after approx. 30 seconds; the green LED (State) and the red LED (DIA) flash slowly (approx. 1 Hz). The new code has now been stored, and the old code is disabled.
5. To activate the handle module's code from the teach-in operation in the locking module, the operating voltage must then be switched off at the locking module for min. 3 seconds. As an alternative, 24 V can be applied to the input RST for at least 3 seconds.

Teach-in in a series connection works analogously. Here, the complete series connection must be restarted using the input RST.

14.2. Mechanical function test

It must be possible to insert the bolt tongue easily into the locking module. To check, close guard several times and actuate door handle.

If available, check function of the escape release. With active guard locking it must be possible to operate the escape release from the inside without excessive effort (approx. 40 N).
14.3. **Electrical function test**

---

**WARNING**

On use in a switch chain with different BR devices (e.g. CES-BR), also follow the procedure for the functional check in the related operating instructions.

---

**With active guard locking monitoring**

1. Switch on operating voltage.
   - The locking module carries out a self-test. In case of BR configuration: The green State LED flashes at 5 Hz for 5 s. The green State LED then flashes at regular intervals.

2. Close all guards and insert the bolt tongue into the locking module.
   - In case of guard locking by solenoid force: activate guard locking.
     - The safety outputs FO1A/FO1B are ON.
     - The machine must not start automatically.
     - It must not be possible to open the guard.
     - The green State LED and the yellow Lock LED are illuminated continuously.

3. Enable operation in the control system.
   - It must not be possible to deactivate guard locking as long as operation is enabled.

4. Disable operation in the control system and deactivate guard locking.
   - The guard must remain locked until there is no longer any risk of injury.
   - It must not be possible to start the machine as long as guard locking is deactivated.
   - It must be possible to open the guard.
   
   Repeat steps 2-4 for each guard.

**With inactive guard locking monitoring**

1. Switch on operating voltage.
   - The locking module carries out a self-test. In case of BR configuration: The green State LED flashes at 5 Hz for 5 s. The green State LED then flashes at regular intervals.

2. Close all guards and insert the bolt tongue into the locking module. As soon as the bolt tongue is inserted into the locking module, the safety outputs FO1A/FO1B are ON. Independent of whether the guard locking is active or not.
   - The machine must not start automatically.
   - The green State LED illuminates continuously. The yellow Lock LED is ON for a long time with a short interruption or is ON continuously (depending on the state of the guard locking).

3. Enable operation in the control system.

4. If necessary, deactivate guard locking and open guard.
   - The machine must switch off and it must not be possible to start it as long as the guard is open.
   
   Repeat steps 2-4 for each guard.

After remedying the cause, use the reset function (see chapter 17. Troubleshooting and assistance on page 51) or briefly disconnect the power supply. Please contact the manufacturer if the fault could not be reset after restarting.

Important: If you do not find the displayed device status in the system status table, this indicates an internal device fault. In this case, you should contact the manufacturer.

### Door monitoring output (OD)

- **State**: self-test, normal operation, door open, door closed, normal operation.
- **Position of the bolt tongue**: normal operation, door closed, bolt tongue inserted.
- **Safety outputs F01A and F01B**: normal operation, door closed, bolt tongue inserted.

### Guard locking monitoring output (GL)

- **State**: self-test, normal operation, door open, door closed, normal operation.
- **Position of the bolt tongue**: normal operation, door closed, bolt tongue inserted.
- **Safety outputs F01A and F01B**: normal operation, door closed, bolt tongue inserted.

### Bolt tongue monitoring output (BT)

- **State**: self-test, normal operation, door open, door closed, normal operation.
- **Position of the bolt tongue**: normal operation, door closed, bolt tongue inserted.
- **Safety outputs F01A and F01B**: normal operation, door closed, bolt tongue inserted.

### Diagnostics monitoring output (DO)

- **State**: self-test, normal operation, door open, door closed, normal operation.
- **Position of the bolt tongue**: normal operation, door closed, bolt tongue inserted.
- **Safety outputs F01A and F01B**: normal operation, door closed, bolt tongue inserted.

### Tips for teach-in operation

- To prevent the interruption of teach-in operations, close the door and push the button for guard locking.
- If a transponder is detected, the teach-in operation will be interrupted.
- If the teach-in operation is not completed within 3 minutes, it will be interrupted.

**Mechanical life**
- In case of use as door stop, and 1 Joule impact energy
  \[1 \times 10^6\]

**Emergency stop**
- Operating voltage: \(5\ldots 24\) V
- Operating current: \(1\ldots 100\) mA
- Breaking capacity max.: \(250\) mW
- Power supply LED: \(24\) V DC

**Controls and indicators**
- Operating voltage: \(UB\) V
- Operating current: \(1\ldots 10\) mA
- Breaking capacity max.: \(250\) mW
- Power supply LED: \(24\) V DC

1. Values at a switching current of 50 mA without taking into account the cable length.
2. Fixed failure rate without consideration of faults in wearing parts.

### 16.1. Radio frequency approvals

**Product description: Safety Switch**

- **FCC ID:** 2AJ58-03
- **IC:** 22052-03

#### FCC/IC-Requirements

This device complies with part 15 of the FCC Rules and with Industry Canada's licence-exempt RSSs. Operation is subject to the following two conditions:

1) This device may not cause harmful interference, and
2) this device must accept any interference received, including interference that may cause undesired operation.

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

NOTE: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes :

1) l'appareil ne doit pas produire de brouillage, et
2) l’utilisateur de l’appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.
16.2. Typical system times

**Important!**
The system times given are maximum values for one device.

**Ready delay:**
- **In case of BR configuration the following applies:** After switching on, the unit carries out a self-test for 5 s.
  The system is ready for operation only after this time.
- **In case of BP configuration the following applies:** After switching on, the unit carries out a self-test for 0.5 s.
  The system is ready for operation only after this time.

**Switch-on time of safety outputs:**
- **In case of BR configuration the following applies:** The max. reaction time from the moment when the guard is locked to the moment when the safety outputs switch on $T_{on}$ is 80 ms.
- **In case of BP configuration the following applies:** The max. reaction time from the moment when the bolt tongue is inserted to the moment when the safety outputs switch on $T_{on}$ is 80 ms.
- **Simultaneity monitoring of safety inputs FI1A/FI1B:** If the safety inputs have different switching states for longer than 50 ms, the safety outputs FO1A/FO1B will be switched off. The device switches to fault state.

**Risk time according to EN 60947-5-3:**
- **With active guard locking monitoring the following applies:** If guard locking is no longer effective, the safety outputs FO1A and FO1B are deactivated after a maximum of 50 ms.
  This value applies to a single switch. For each additional switch in a chain the risk time increases by 10 ms.
- **With inactive guard locking monitoring the following applies:** If the bolt tongue is pulled out of the locking module, the safety outputs FO1A and FO1B are deactivated after a maximum of 50 ms.
  This value applies to a single switch. For each additional switch in a chain the risk time increases by 10 ms.

**Difference time:** The safety outputs FO1A and FO1B switch with a slight time offset. They both have the ON state at the latest after a difference time of 10 ms.
17. Troubleshooting and assistance
Simple errors (DIA is flashing) are reset by opening and closing the guard. If the error is not reset by this action, proceed as follows:

17.1. Resetting errors
Proceed as follows:
1. Open the guard.
2. Switch off operating voltage at the locking module for min. 3 seconds or connect 24 V to the input RST for min. 3 seconds.
   Alternatively, the internal reset (see 7. System overview on page 13) can be pressed for 3 seconds with a pointed object, e.g. small screwdriver.
   ➡️ The green LED (State) flashes quickly (approx. 5 Hz in case of BR configuration). A self-test is performed during this time (approx. 5 s in case of BR configuration). The LED then cyclically flashes three times.
3. Close guard and switch on guard locking;
   ➡️ The system is in normal operation again.

17.2. Troubleshooting help on the Internet
You will find a help file on troubleshooting under “Support” in the service area at www.euchner.com.

17.3. Mounting help on the Internet
You will find an animation on the mounting process at www.euchner.com.

17.4. Application examples
You will find application examples on connecting the device to various control systems at www.euchner.com.

18. Service
If servicing is required, please contact:
EUCHNER GmbH + Co. KG
Kohlhammerstraße 16
70771 Leinfelden-Echterdingen

Service telephone:
+49 711 7597-500

E-mail:
info@euchner.de

19. Inspection and service

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loss of the safety function because of damage to the device.</td>
</tr>
<tr>
<td>› In case of damage, the affected module must be replaced completely. Only accessories or spare parts that can be ordered from EUCHNER may be replaced.</td>
</tr>
<tr>
<td>› Check the device for proper function at regular intervals and after every fault. For information about possible time intervals, refer to EN ISO 14119:2013, section 8.2.</td>
</tr>
</tbody>
</table>

Regular inspection of the following is necessary to ensure trouble-free long-term operation:

› Check the switching function (see chapter 14.3. Electrical function test on page 41)
› Check the secure mounting of the devices and the connections
› Check for soiling

No servicing is required. Repairs to the device are only allowed to be made by the manufacturer.

20. Declaration of conformity

Die nachfolgend aufgeführten Produkte sind konform mit den Anforderungen der folgenden Richtlinien (falls zutreffend):
The beneath listed products are in conformity with the requirements of the following directives (if applicable):
Les produits mentionnés ci-dessous sont conformes aux exigences imposées par les directives suivantes (si valable):
I prodotti sotto elencati sono conformi alle direttive sotto riportate (dove applicabili):
Los productos listados a continuación son conforme a los requisitos de las siguientes directivas (si fueran aplicables):

I: Maschinenrichtlinie
Maschinen directive
Directive Machines
Direttiva Macchine
Direciva de máquinas
2006/42/EG
2006/42/CE
